

8th Norfolk

Some Impacts of Mass Save and Alternative Compliance Payments in the 8th Norfolk House District, represented by Rep. Edward Philips

Over the decade from 2012-2023, efficiency investments in Massachusetts created \$34 billion in lifetime benefits, a 3.5x return on every dollar spent. Here are conservative, partial estimates of some of the benefits received by the 8th Norfolk district:

- In the last Mass Save plan, from 2022-2024, households in this district received \$13,214,000 in gas and electric incentives.
- Last year, households in this district received \$1,538,000 in Mass Save weatherization incentives, which bring down energy bills by reducing home energy use. This was more than 80% of other districts received. 42% of this money went to Low and Moderate-Income Households (<80% of state median income).
- Last year, households in this district received \$1,691,000 in Mass Save heat pump incentives, helping families access efficient heating and cooling year-round. This was more than 70% of other districts received. 45% of this money went to Low and Moderate-Income Households (<80% of state median income).
- 42% of the district has adopted the Specialized Code, which requires Passive House certification for new multifamily buildings above 12,000 square feet.

And these district-level investments only tell part of the story.

- The Massachusetts clean energy industry employs more than 115,000 people and contributes \$15.9 billion to the Gross State Product. A majority of these jobs are in energy efficiency, demand management, and clean heating and cooling.
 - 58% of these companies are small businesses with 10 or fewer workers.
 - 74% of these jobs are outside Route 128.
- Even households who don't receive direct incentives still benefit from lower peak loads.
 - Much of the state's grid infrastructure sits idle most of the year, existing just to serve peak demand. 10% of electricity use is responsible for 40% of electricity costs.
 - Efficiency programs like weatherization, deep energy retrofits, and Passive House cut peak demand and could save ratepayers 950 million annually by 2030.

These incentive estimates are conservative and do not represent the full impact of Mass Save and ACP, since they exclude many categories of spending (e.g. commercial and industrial incentives) that are not broken out geographically across the state. Compiled by Alexander Gard-Murray, PhD, MSc, Executive Director of Passive House Massachusetts and Fellow at the Greenhouse Institute, based on data from Mass Save, MassCEC, MassGIS, Mass DOER, Phius, PHI, the Acadia Center, and LISC.
